BST Construction from Given Elements

Problem Statement

Write a C++ program to construct a Binary Search Tree (BST) using the elements **14, 15, 4, 9, 7, 18, 3, and 5** in the given order. Insert each element into the BST according to the Binary Search Tree property: values smaller than a node are placed in its left subtree, while values greater than a node are placed in its right subtree. After constructing the tree, display all three depth-first traversals: **Inorder** (Left, Root, Right), **Preorder** (Root, Left, Right), and **Postorder** (Left, Right, Root). Clearly label each traversal in the program output and display the elements in the correct order.
