Title :- BST Construction from Given elements:

Problem Statement :- Write a c++ program to construct a Binary Search tree (BST) using the elements 14, 15, 4, 9, 7, 18, 3 and 5 in the given order and display all three depth-first traversals : inorder, preorder, and post order.

Objectives :-
1) To understand the concept of a Binary search tree
2) To construct a BST by inserting elements in the given order.
3) To implement inorder, preorder and postorder traversals.
4) To display the elements of the BST using depth-first traversal techniques.

Algorithm :-
Step 1 : Start
Step 2 : Define a node structure containing data, a left pointer.
Step 3 : Initialize the root of the BST as NULL
Step 4 : insert the elemeny 14, 15, 4, 9, 7, 18, 3, 5 into the BST in the given order.

Step 5: perform inorder traversal:

- Traverse the left subtree
- Visit the root node
- Traverse the right subtree

Step 6: perform preorder traversal:

- Visit the root node
- Traverse the left subtree
- Traverse the right subtree

Step 7: perform postorder traversal

- Traverse the left subtree
- Traverse the right subtree
- Trav Visit the root node.

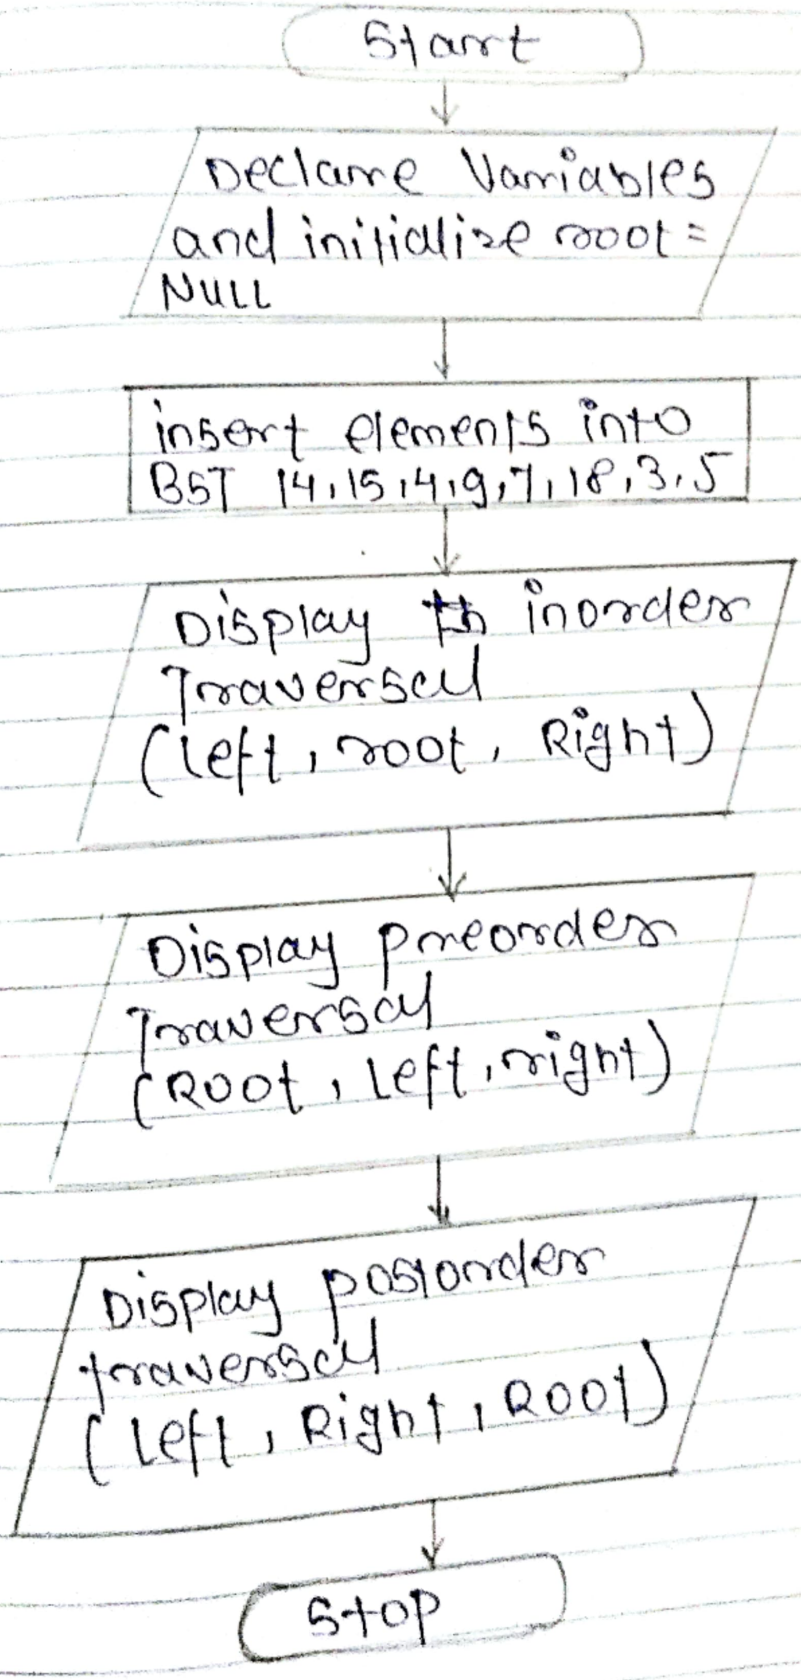

Step 8: Display the results of all three traversals.

Step 9: Stop.
